

High accuracy & High Performance

HM5000 Series

MASS FLOWMETER / CONTROLLER

OUTLINE

HM5000 series is Thermal Mass Flowmeter and Controller, which measure various kinds of gas.

The flow rate of gas from 5mL/min(nor) to 400L/min(nor) can be measured and controlled without being influenced by the change in temperature and pressure.

There are two types available: Mass Flowmeter to measure flow rate and Mass Flow Controller with control valve built in, and also available in high performance and wide use types. Selection can be made depending upon the applications.

FEATURES

- ☐ Flow rate measurment in wide range

 Available for wide range from 0 to 5mL/min(nor) to 0 to 400 L/min (nor).
- ☐ High accuracy ±1%F.S. (High performance type)
- ☐ Miniaturization and improvement of reliability
- ☐ The following functions possible to add optionally.
 Slow start function (Normal close type)
 Output signal : 1 to 5VDC

APPLICATIONS

- Utility gas supply lines in industries
- □ Various instruments for analysis
- ☐ Semiconductor gas supply lines
- ☐ Gas constant flow control and mixture control
- Embedded devices

The calibration criterion is 0 $^{\circ}$ C and 1 atm. (Calibration can be made in other temperatures.)

The standard flow range is for N_2 gas. The range may vary depending on the kind of gas.

NC and NO stands for "Normal close type" and "Normal open type" respectively.

500L/min(nor) is possible in flow range. (N_2 Conversion)

Chloroprene rubber is available for the sealing material.

EXAMPLE OF MODEL SELECTION

Flow range indicates the flow rate on the basis of N2 gas.

When measuring other gases than N_2 , the flow rate converted to N_2 gas shall be obtained by the below-mentioned Conversion Factor (CF), and then confirm if it is in the desired model.

The flow rate converted to $N_{\scriptscriptstyle 2}$ gas can be obtained by the following formula.

In case of single component:

Flow rate converted to
$$N_2$$
 gas = $\frac{\text{Flow rate of gas to be used}}{\text{CF}}$

In case of mixed gas:

CF of mixed gas shall be obtained, and then the conversion to N₂ gas shall be made as well as the single component.

CF of mixed gas =
$$\frac{1}{\frac{X1}{CF1} + \frac{X2}{CF2} + \cdots + \frac{Xn}{CFn}}$$

X1 : Density of Component 1 (VOL%/100) X2 : Density of Component 2 (VOL%/100)

1 1

Xn: Density of Component n (VOL%/100)

CF1 : CF of Component 1
CF2 : CF of Component 2
: :

CFn : CF of Component n
